

Maxie Framework

Maxie Framework is a web based server application, designed to provide the security and access framework into which a variety of function software modules can be plugged. Maxie Framework ensures security by encrypting sensitive data before it is transferred across the net. Maxie Framework supports concurrent user access to the underlying databases and retains user preferences. Maxie Framework is entirely server sided, only requiring the client to run Microsoft Internet Explorer 6.0 or later which normally comes standard with PC distributions.
